# Lithops - Flowering Stones

## Synopsis

The genus Lithops belongs into the plant family of Mesembryanthemaceae (midday flowers) - well known by the short term 'Mesembs' to the amateurs of these succulents. The name 'Lithops' (derived from Greek  $\lambda\acute{\iota}\theta\omicron\varsigma$  = stone and  $\acute{\omicron}\psi\iota\varsigma$  = appearance) itself hints at the amazing resemblance between the plants and the stones surrounding them; it is this particular phenomenon which allows them to employ one of their most obvious survival strategies. The otherwise defenceless plants have developed forms and features adapting them to their physical environment with such perfection that it is extremely difficult to spot them in habitat.

## Customer Reviews

I love growing exotic cacti and succulents and needed advice with these guys. This is great to read on my laptop but it is more difficult on my kindle fire HD. I love the pictures of the different species, I especially needed to get pointers on raising from seed. Mr Schlosser knows his stuff and I'm glad this was available for a reasonable price

Although packed with information, this book lacked common sense knowledge and help for the

average gardener. Very few photos. As there is very little available in print on Lithops, this was worth the time, but not something I would buy. Glad it's available to borrow.

Lithops cannot be treated like other succulents. This book gave me a lot of very good information about my new Lithops. Worth reading.
